100	20	20	0	70	100

Tabelle 2: water value calculation for inflow 20GWh

1 Water value

The water value is the expected value of stored MWh depending on capacities and inflow¹. If the water value in a reservoir is known, the value enals the value the additional water will decrease the marginal costs when it is stored.

2 Calculation

The calculation for water values for three different inflow (10GWh, 20GWh, 30GWh) are listed in tables 1, 2 and 3.
